Protocol Reliability / Senior Backend Engineer

I design and build backend systems that stay reliable under real-world pressure — and recover safely when something goes wrong.

Story Arc

Security
Regulated systems → learned how failures damage trust.

Scale
High-traffic products → reliability under load, fraud/abuse, and incident pressure.

Reliability
Infrastructure + protocol→ preventing the few failures that are hard to undo.

Professional Summary

I'm a backend engineer who builds systems that last. I don't just find problems — I design, implement, and ship solutions that make them unlikely to repeat.

I focus on clean architecture, safe releases, clear observability, and practical guardrails — so teams can ship without constant production stress.

~$4M secured — zero major security incidents (3 yrs)

10× throughput — at constant hosting cost

~65% → ~92% — reliability improvement in production

60% cloud cost cut — simplification without SLA loss

99% gas reduction — redesigned on-chain workflow

Skills

- **Languages:** TypeScript/Node, Python, Rust, Go
- **Backend:** APIs, WebSockets, Microservices, Distributed systems
- **Cloud:** AWS, GCP, Docker, CI/CD, Kafka/RabbitMQ
- **Reliability:** Prometheus, Grafana, OpenTelemetry
- **Security:** DevSecOps, Threat modeling, Applied crypto

Where I Fit Best

- Products where outages hurt brand trust and revenue.
- Teams that want fewer incidents and calmer on-call.
- Systems where money, identity, or uptime are high-stakes.
- Startups or larger orgs — as long as reliability matters.

Experience

VENT Finance — Web3 Asset Platform

Senior Backend / Security Engineer | 2021–2024

Designed and operated a secure, production-grade backend for a money-moving platform — stable, cost-efficient, and audit-ready.

- Operated production systems securing ~$4M in assets with **zero security incidents**
- Partnered with auditors to reach **9/10 external audit score**
- Simplified AWS architecture for **60% cost reduction** while preserving uptime and SLA
- Redesigned on-chain workflows for **99% gas savings** by tightening boundaries and retries
- Brought backend/infra/security in-house; avoided **$50K** outsourcing

---

Revision — High-Traffic Gaming SaaS

Senior Backend Engineer | 2020–2021

Rebuilt and scaled a high-traffic backend so it handled growth without reliability trade-offs.

- Scaled throughput **10×** for thousands of concurrent users with no hosting cost increase
- Improved reliability **~65% → ~92%** via safe retries, recovery design, and guardrails
- Built fraud pipeline; flagged **~10%** suspicious activity and reduced abuse load
- Reduced incident recovery from minutes to seconds

Vexor Network — AI enabled Protocol

Fractional CTO / Senior Engineer | 2024–2025

Built and hardened a production-ready backend foundation before public launch.

- Added caching + observability (–40% latency), plus rate limiting + validation to block early abuse
- Built CI/CD + environments for predictable releases and safe rollback (~25% cycle improvement)
- **Result:** stable beta launch with no major incidents

BlockByBlock — Community Steering

Technical Founder / Senior Engineer | 2025–2026

Turned unclear ideas into a working demo and a backend foundation that won't collapse later.

- Shipped investor demo in **10 days**; prevented **~$10k** wasted build and clarified scope
- Built backend with production primitives: validation, idempotency, observability, failure boundaries
- Shaped vague requirements into clear components with predictable failure behavior

Protocol & Founding Work

- **NEAR Threshold Signatures / MPC** — improved safety and reliability of cryptography-heavy infrastructure: fixed DoS/correctness issues and sped up critical paths (80×+). (Focus: guardrails, recoverability, and avoiding hard-to-reverse failures.)
- BugDasht (Founding Engineer) — shipped cybersecurity MVP idea-to-live in 8 months
- Khavar (Technical Co-Founder) — verifiable blockchain MVP (Hyperledger) in 3 months
- dTip — open-source Web3 donation dApp with transparent on-chain flows
- DCPay — autonomous crypto payment acceptance with in-house verification + settlement

Education & Certs

- Google Vertex Generative AI – Google Cloud (2025)

- OLAS Autonomous Agents Certification – Valory (2024)
- Certified Ethical Hacker (CEH) – EC-Council (2019)
- M.Sc. Software Security (2017) • B.Sc. Software Engineering (2014)

Next Step

If your product is growing and you want fewer incidents, safer releases, and calmer operations, let's talk. I can do a short hardening sprint: identify the top failure risks, improve recovery, and ship practical guardrails.
